Technology has become an inspiration for governments and peoples with the successful global models it provides for development in which technology and international trade play a fundamental role in developing relations between governments and peoples to ensure a better future for the human community and the consolidation of societal and global peace standards. Hence, developing or developed human societies make great efforts to employ the contemporary "information revolution" to provide an opportunity for their members to benefit from the knowledge and skills they contain and then use them to confront their current and future problems, practical and scientific ones, especially since there are many indications that the twenty-first century carry many challenges that will rapidly change the world from its current state to a more advanced one. ICT tools and modern methods are an essential tool in providing a fertile environment to support Cooperative cooperation and teamwork between governments and peoples and between people themselves. ICT tools provide governments - in small or large groups - multiple sources for collecting, analyzing, displaying, its use and transportation over long distances, which develops the skills of cooperation and work in a group of governments at the local and global levels, which is reflected positively on international and local trade. The rapid and successive developments in information and communication technology - associated with low costs and the emergence of high-capacity memories - have had the greatest impact on developing the use of multimedia technology in the field of education and training because of their great potential in employing all or most of the means or means of learning together in strong, effective program packages.
