

The importance of building strong generations and raising a new generation full of hope, ideas, vitality and activity will not and has never been an easy thing in raising them until they are among the best people. On it, as long as the youth and future generations are the ones on whom we build the hope for a better future. That is, every person and everything will be connected to the Internet, so any tool or device at home or in the street or any workplace will be connected to the internet, and this is what leads us to the term smart cities , as the data is formed every place by any person or any machine and it will be analyzed in the least real time possible to infer useful information in a timely manner such as monitoring the health status of patients and the elderly, and monitoring devices and tools at home and determining whether there is a malfunction or a lack of a substance, as well as an analysis Street traffic situation and assisting drivers and warning them of invisible dangers, which paves the way towards self-driving cars. Here, mobile communications play a pivotal role in enabling the effective and safe transfer of this information from one machine to another machine (= MACHINE TO MACHINE M2M) - without human intervention - to address it take the appropriate action as hard as possible speed and less delay (less than 1ms). This poses more challenges for the future network that must absorb mobile phone data and the huge number of devices and sensors deployed everywhere to be a large-scale network with maximum capacity and efficiency and a high degree of hardware security information transferred and stored. Decision making can be difficult, which is inevitable in everyday life. We tend to think that there are only a few difficult decisions in life, such as "Should I take this position or that job?" Or "Should I buy or rent a house?" While these are big decisions, what makes them difficult are the choices. When each option is equal, it makes the decision difficult. However, there are ways to make the decision less difficult by evaluating options, looking at long-term results, and thinking about options that have been made. Doing these techniques in the governments and peoples is a great way to ease them in life.
